

Safe travel in the nightliner of the future  
Fast air exchange up to 10 times per hour and active filter system

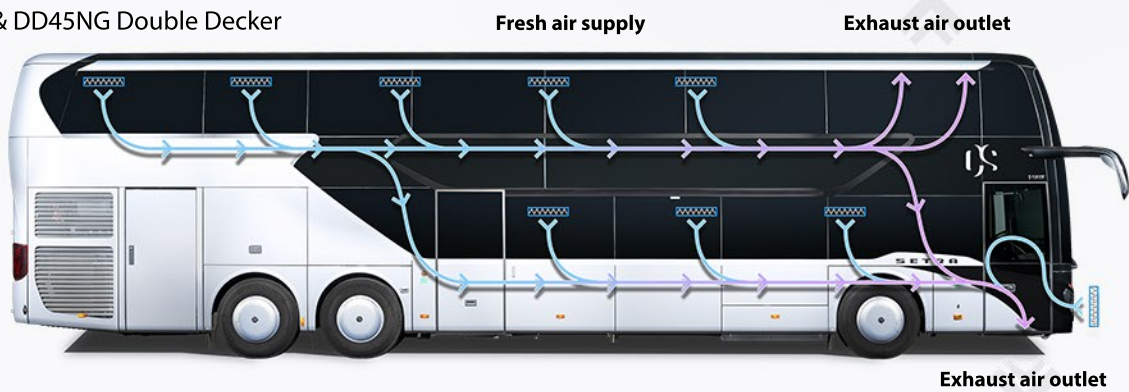

Rapid air exchange has been proven to reduce the risk of viruses spreading. The entire air in our nightliners is exchanged up to 10 times per hour in fresh air mode (mixed air / recirculated air). Fresh air and recirculated air are fed to the passenger compartments and beds via an effective filter system. The smallest particles and aerosols are filtered before the air enters the vehicle interior.

**Safety through partial air exchange in the climate zones and each individual bed on board.**

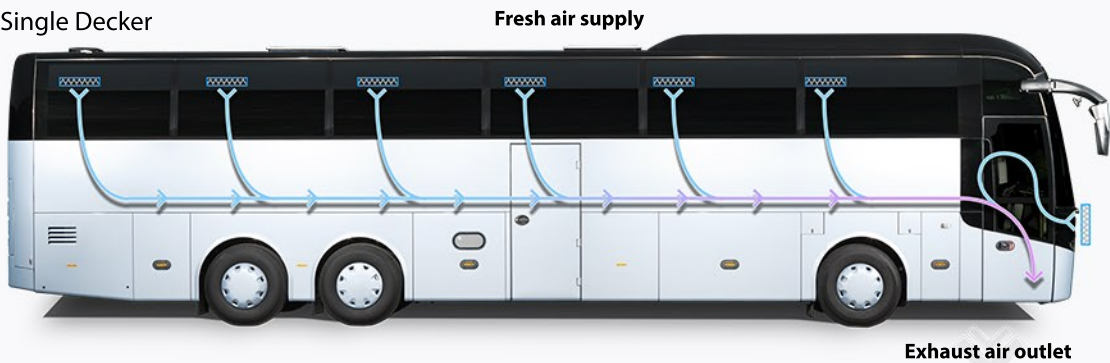

Separate filtered supply air and exhaust air recirculation ensure partial air exchange in the interiors and beds. This prevents the accumulation or distribution of aerosols.
